

AI Tools Usage Report

Full Name	Arber Ramadani
Module	M2: JavaScript
Project Title (Brand Name)	The Vitaminka Tap Rush Game
Link to Live Site	https://final-project-vitaminka.netlify.app/

1. AI Tools Used

Tool Name	Purpose	Used For	Final Output Used? (Yes/No)
ChatGPT	Debugging	Partial Code Functionality	Yes
Gemini	Logic	Combo logic	Yes

2. Prompt Examples & Edits

Provide at least two AI prompt examples and explain how you used (or modified) the results.

Example 1

- Tool Used: Gemini
- Prompt You Gave: "How do I make a progress bar for a game timer that shrinks as the time goes down in Vanilla JS?"
- AI Response Summary: Provided a CSS structure for a container and a JS function using `setInterval` to reduce the width percentage.
- How You Used/Modified the Output: I had to modify the code to match my `GAME_DURATION` constant. I also added my own logic so the bar appears below the score, timer and combo.

Example 2

- Tool Used: ChatGPT
- Prompt You Gave: "have a snack-clicking game. Can you give me a small JavaScript function that handles a 'Combo Shield'? I want the player to not lose their combo for 1.5 seconds after they click a good item, even if they accidentally click a bad item right after."

- **AI Response Summary:** The AI provided a logic snippet using a boolean variable (`isShielded`) and a `setTimeout` function to toggle it back to false after 1500ms.
- **How You Used/Modified the Output:** I integrated the `isShielded` variable into my existing `GameState` object. I modified the `handleInput` function to check this shield before deducting points or resetting the combo. I also added a floating text "SHIELDED" so the player knows why they didn't lose their streak, making the game feel more forgiving.

3. Reflection Questions

Answer briefly in bullet points or 2–3 sentence reflections.

- *What was the most helpful AI tool and why?*
- The AI was most helpful for explaining **logic flows**, like how to calculate a score multiplier based on a combo. As a beginner, it's easier to understand the math when it's broken down into simple `if/else` statements.
- *What did you learn from using AI in your project?*
- I learned that file structure and naming conventions (like using an `assets` folder) are critical when moving from a local computer to a live server like Netlify.
- *What challenges did you face with AI-generated content/code?*
- Sometimes the AI suggested complex "Fever Mode" code that used functions I hadn't learned yet. I had to ask it to simplify the code so I could actually understand how it was interacting with my HTML elements.
- *What would you do differently next time?*
- Next time, I would plan my folder structure (images, CSS, JS) *before* I start coding. This would prevent any errors and broken paths I had to fix at the end of this project.
